

Amendments of the Specification

Please replace Paragraph [0036] with the following amended Paragraph [0036]:

[0036] In another preferred embodiment 80, as shown in FIG. 8, instead of providing additional openings, such as openings 53, particular ones 810 of openings 81 (similar to openings ~~[[11]]~~ 12, 51), may be provided in such a way that the phase of light transmitted through them is altered. For example, a lens, filter or other optical element 84 that changes the relative phase, or the intensity or amplitude, of light passing through it could be provided at each feature 810. The degree to which the transmissivity of features 810 can or should be changed depends in part on the photosensitivity of the photoresist material. While these features 810 participate in the formation of structures on the semiconductor wafer, they also break up the three-fold symmetry.
